

MAYFLOWER × VILL CONSULTING GROUP

PHASE 1

DIGITAL EXPERIENCE & RESTAURANT OPERATIONS PLATFORM

DEVELOPER SCOPE & PRODUCT REQUIREMENTS DOCUMENT

Functional Scope • User Roles • Workflows • Integrations • Technical Requirements • Acceptance Criteria

Prepared by VILL Consulting Group September 2026 Target implementation: 4–6 weeks

01 — DOCUMENT PURPOSE

This document is the functional baseline for Phase 1 development. It defines what is being built, who will use it, how the principal workflows should operate, what integrations are expected, and what must be validated before release.

Use this document for architecture, UI/UX, database design, API planning, development, testing, UAT and deployment. Requirements outside this document must be clarified before implementation.

02 — PRODUCT OBJECTIVE

Build a connected digital layer around Mayflower that combines a premium public website with a secure customer and restaurant operations web application. The platform should improve customer convenience, reservations, table allocation, outlet administration, daily operating discipline and management visibility.

The application is not a replacement for Petpooja and is not a full POS/ERP in Phase 1. Petpooja remains the existing restaurant system; the Mayflower platform provides the customer, management and operational layer around it.

03 — PRODUCT ARCHITECTURE

Layer	Purpose
Public Website	Customer-facing brand, menu, outlet, franchise and reservation experience.
Web Application	Secure customer, reservation, outlet, SOP, task and management platform.
Integration Layer	Connect agreed third-party systems including Petpooja, loyalty and CCTV where technically feasible.
Management Layer	Role-based dashboards, operational visibility, feedback and actionable information.

Core flow: Website → Customer Experience → Web Application → Restaurant Operations → Integrations → Management Visibility.

04 — USER ROLES & ACCESS

Role	Primary access
Super Admin	Full system, configuration, users, roles, outlets and integration controls.
Owner / Management	Business-wide visibility, dashboards and operational overview.
Admin	Administrative and operational management across authorised modules.
Manager	Outlet reservations, tables, SOPs, tasks, feedback and daily operations.
Chef	Assigned kitchen SOPs, checklists and operational tasks.
HR	Relevant employee/HR workflows available in Phase 1.
Accountant	Relevant financial/business information available through authorised integrations.
Customer	Registration, profile, reservations, loyalty information and feedback.

RBAC is mandatory. Both frontend visibility and backend/API authorisation must enforce permissions.

05 — PUBLIC WEBSITE

5.1 Core pages

- Home
- About Mayflower
- Food Menu
- Outlets / Locations
- Franchise
- Contact
- Reservation entry point

- Customer Login / Registration

5.2 Requirements

- Responsive on desktop, tablet and mobile browsers.
- Clean, premium and performance-conscious experience.
- SEO-ready technical structure.
- Secure enquiry and document forms.
- Agreed dynamic content manageable through the backend.
- Connected to the web application for reservations and outlet data.

5.3 Dynamic outlet publishing

Authorised admin creates outlet → enters details → configures content → approves/publishes → outlet becomes visible on the public website. Routine outlet creation must not require developer or direct database intervention.

06 — MENU

- Categories
- Food item name
- Description
- Price
- Image
- Availability/status where required

Menu content should be manageable through the backend for agreed dynamic fields.

07 — CUSTOMER ACCOUNT & PROFILE

- Registration and login/logout
- Profile management
- Contact details
- Reservation history
- Loyalty information where integrated
- Feedback history
- Relevant customer activity

Use secure authentication. Customer information must not be exposed to unauthorised users or endpoints.

08 — RESERVATION MANAGEMENT

8.1 Customer

- Select outlet
- Select date
- Select time
- Enter party size
- Submit reservation
- View status
- View reservation history

8.2 Management

- View and filter reservations
- Filter by outlet/date/status

- View customer details
- Approve/reject
- Modify
- Allocate table
- Change status

8.3 Statuses

- Pending
- Confirmed
- Cancelled
- Completed
- No-show

8.4 Workflow

Customer → Reservation Request → Manager Review → Table Availability → Table Assignment → Confirmation → Visit → Completion/No-show

09 — TABLE & FLOOR MANAGEMENT

- Configure outlet, floor/section, table number/name and seating capacity.
- Statuses: Available, Reserved, Occupied, Cleaning, Blocked.
- Provide a visual table/floor map where Mayflower supplies usable floor-plan information.
- Manager can view availability and assign a table to a reservation.
- Table status changes should be reflected in relevant management views.

The map should be fast and practical for restaurant staff; avoid unnecessary visual complexity.

10 — MULTI-OUTLET MANAGEMENT

- Create/edit outlet
- Outlet status
- Address/location
- Contact details
- Operating hours
- Images/description
- Outlet-specific configuration
- Publish/unpublish

Every outlet-related record must be associated with the correct outlet. Architecture must support future outlet expansion.

11 — FRANCHISE MANAGEMENT

- Public franchise information
- Franchise enquiry
- Lead capture
- Applicant details
- Document upload
- Admin review
- View/download submitted documents
- Status tracking
- Internal notes where required

Initial statuses: New, Under Review, Contacted, Qualified, Closed. Full franchise ERP is outside Phase 1.

12 — MANAGEMENT DASHBOARD

- Outlet overview
- Reservation overview
- Pending reservations
- Operational checklist status
- Customer activity
- Feedback
- Relevant Petpooja-integrated data
- Relevant operational reports
- User/activity visibility

Dashboard design should focus on information that helps management decide or act.

13 — ROLE-BASED DASHBOARDS

Owner: business-wide visibility. Admin: system and operational administration. Manager: outlet-level operations. Chef: kitchen workflows. HR: relevant employee workflows. Accountant: relevant financial/business views. Customer: profile, reservations, loyalty and feedback.

14 — RESTAURANT OPERATIONS & SOP

14.1 SOP categories

- Opening
- Closing
- Kitchen
- Floor
- Hygiene
- Equipment
- Customer service
- Quality checks
- Other Mayflower-approved procedures

14.2 Checklist fields

- Checklist name
- Outlet
- Assigned role/user
- Date
- Task
- Priority
- Status
- Completion time
- Remarks
- Photo evidence
- Geo-location where applicable

14.3 Task statuses

- Pending

- In Progress
- Completed
- Escalated

14.4 Escalation

Overdue or incomplete critical tasks should be surfaced to the appropriate manager. Exact escalation timing/rules will be confirmed during discovery.

15 — PHOTO & GEO-TAGGED EVIDENCE

- Capture/upload operational photo
- Associate with task/checklist
- Timestamp
- User
- Outlet
- Geo-location where permission is available
- Manager visibility

Camera and location access must respect browser/device permissions.

16 — CUSTOMER FEEDBACK

- Rating
- Comments
- Outlet association
- Customer association where applicable
- Timestamp
- Status
- Admin/manager visibility
- Filtering by outlet/date/status where relevant

17 — LOYALTY INTEGRATION

Integrate an approved loyalty/customer-engagement provider. Keep the architecture provider-agnostic until the selected provider is technically validated.

- Customer loyalty profile
- Points
- Rewards
- Offers/coupons
- Customer engagement
- Feedback connection where supported

Validate API, authentication, feature availability and technical limitations before final integration.

18 — PETPOOJA API INTEGRATION

Petpooja remains the existing POS/restaurant system. The Mayflower application should consume agreed information through authorised APIs and present it in relevant management views. Do not rebuild POS or accounting functionality.

18.1 Required validation

- Obtain API documentation and access.
- Confirm authentication method and credentials.
- Identify available endpoints.

- Confirm rate limits and data restrictions.
- Confirm read/write capability.
- Map required fields.
- Identify unavailable data.
- Implement agreed endpoints.
- Test data accuracy and failure handling.

18.2 Potential data — subject to API availability

- Sales
- Orders
- Inventory
- Staff/HR information
- Outlet information
- Relevant reports

Only data confirmed as available through authorised Petpooja access should be committed to implementation.

19 — CCTV INTEGRATION

CCTV integration is software-level and subject to the existing CCTV/DVR/NVR environment.

- Validate manufacturer/model
- Check API or RTSP availability
- Check authentication
- Check network accessibility
- Confirm stream format/browser compatibility
- Confirm required feeds
- Confirm hosting/security constraints

Excluded from software scope: camera replacement, new DVR/NVR, cabling, installation and major network infrastructure work.

20 — KITCHEN & FLOOR VISIBILITY

- Floor/table status
- Reservations
- Relevant floor operations
- Kitchen task/checklist visibility
- Relevant operational status

Phase 1 does not include a full Kitchen Display System or POS replacement.

21 — NOTIFICATIONS

- Reservation confirmation/status
- Task assignment
- Task escalation
- Feedback/admin alerts

Email, SMS or WhatsApp delivery depends on approved providers and available APIs. Exact channels are to be confirmed.

22 — ADMINISTRATION

- User management
- Roles and permissions

- Outlets
- Tables
- Reservations
- Menu/content
- Franchise enquiries
- SOPs/checklists
- Tasks
- Feedback
- Integration configuration
- Basic system settings

23 — SEARCH, FILTERING & ACTIVITY

- Provide search/filtering in relevant management modules.
- Common filters: outlet, date, status, user, reservation and feedback.
- Maintain basic audit/activity records for material actions such as user creation, reservation changes, table assignment, task completion, outlet publication and administrative configuration changes.

24 — FILE UPLOADS

- Franchise documents
- Operational photographs

Implement file-type validation, size limits, secure storage and access control. Uploaded files must not be publicly accessible without authorisation.

25 — TECHNICAL FOUNDATION

- Secure authentication
- RBAC at frontend and backend/API layers
- Structured data model
- Modular backend
- Responsive frontend
- Secure API communication
- Development/test/production environments
- Input validation
- Error handling
- Application logging
- Backup strategy
- Production HTTPS
- Architecture suitable for Phase 2 expansion

Do not tightly couple modules in a way that forces Phase 2 to rebuild the Phase 1 foundation.

26 — SECURITY

- Secure authentication and password handling
- Authorisation on every protected API
- Input and file validation
- Secure file storage
- Least-privilege access

- HTTPS in production
- Protection of customer information
- Basic audit logging
- No secrets in source control

API keys, credentials and secrets must be stored using appropriate environment/secret management.

27 — RESPONSIVE & DEVICE REQUIREMENTS

- Public website: desktop, tablet and mobile.
- Web application: desktop/tablet plus practical mobile-browser use for managers and operational staff.
- Camera/location workflows must work within supported browser/device permissions.

Phase 1 is a web application. Separate native iOS/Android applications are not part of this scope.

28 — HIGH-LEVEL DATA MODEL

The schema should account for Users, Roles, Permissions, Customers, Outlets, Floors/Sections, Tables, Reservations, SOPs, Checklists, Tasks, Evidence, Feedback, Franchise Enquiries, Menu Items, Loyalty references, Integration configurations and relevant reporting data.

Developer to produce the final ER/data model during architecture.

29 — CORE USER FLOWS

29.1 Customer reservation

Website → Outlet → Date/Time → Guests → Login/Register → Reservation Request → Manager → Table Assignment → Confirmation

29.2 Daily operations

Manager → Checklist/Task → Employee → Complete → Photo/Geo → Submit → Manager Review → Complete/Escalate

29.3 New outlet

Admin → Create Outlet → Configure → Add Content → Approve → Publish → Website Update

29.4 Management data

Petpooja / Reservations / Operations / Feedback / Outlets / Loyalty → Backend → Management Dashboard

30 — DEVELOPMENT PRIORITY

Priority	Scope
P0 — Core	Authentication, RBAC, website, customer profile, reservations, tables, outlets and admin foundation.
P1 — Operations	SOPs, checklists, tasks, photo/geo evidence, feedback and management dashboard.
P1 — Integrations	Petpooja, loyalty and CCTV subject to technical feasibility.
P2 — Refinement	Notifications, reporting refinements, UI polish, performance optimisation and minor workflow improvements.

31 — IMPLEMENTATION TIMELINE

Target delivery window: 4–6 weeks from project commencement, subject to timely client inputs, approvals, credentials, third-party access and UAT.

Period	Primary focus
Week 1	Discovery, final requirements, architecture, database direction and UX/UI direction.
Week 2	Website, authentication, customer foundation, outlet foundation and application shell.

Period	Primary focus
Week 3	Reservations, tables/floor, roles, dashboards and SOP/checklists.
Week 4	Petpooja, loyalty, feedback, photo/geo and operational workflows.
Week 5	Integration testing, functional QA, UAT and bug fixing.
Week 6	Final refinements, production configuration, deployment, verification and handover.

Workstreams may run in parallel where dependencies permit.

32 — MAYFLOWER TEAM AVAILABILITY

To protect the 4–6 week timeline, Mayflower should nominate a primary decision-maker/project coordinator and make relevant operational and technical stakeholders reasonably available.

- Requirement clarification and process walkthroughs
- Timely UX/UI and workflow approvals
- Brand/content/menu/outlet assets
- SOP and checklist inputs
- User-role confirmation
- Petpooja API access and coordination
- CCTV technical information/access
- Loyalty provider coordination
- UAT participation and consolidated feedback

Feedback should be consolidated through the nominated coordinator wherever possible. Delays in approvals, credentials, third-party access or UAT feedback may extend the delivery timeline.

33 — DEVELOPER WORKING PRINCIPLES

- Build the agreed requirement, not assumptions.
- Do not duplicate functionality already provided by Petpooja.
- Validate third-party integrations early.
- Keep modules modular and Phase-2 ready.
- Prioritise simple, fast operational workflows.
- Use reusable components and clean data structures.
- Document integration limitations clearly.
- Do not introduce major features without scope confirmation.

34 — TESTING & UAT

- Unit testing for critical business logic
- API/integration testing
- Role and permission testing
- Responsive/device testing
- Reservation/table workflow testing
- File upload validation
- Photo/location permission testing
- Integration failure/error-path testing
- Basic security validation
- Production smoke testing

UAT will be performed with Mayflower stakeholders against the approved scope. In-scope critical defects should be resolved before go-live.

35 — DEFINITION OF DONE

- Required functionality implemented.
- Correct permissions enforced.
- End-to-end workflow works as designed.
- Data correctly stored and retrieved.
- Agreed integrations validated.
- Responsive behaviour acceptable.
- Critical errors resolved.
- UAT criteria met.
- Production deployment successful where applicable.

36 — PHASE 1 EXCLUSIONS

- Full POS or replacement of Petpooja
- Full accounting software
- Payroll
- Complete HRMS
- Full ERP
- Advanced procurement
- Advanced inventory ERP
- Full franchise ERP
- Advanced AI systems
- AI voice/calling
- Advanced marketing automation
- Advanced BI/data warehouse
- Native iOS/Android apps
- CCTV hardware/infrastructure work
- Unapproved third-party integrations
- Major functionality not expressly described in this document

37 — CHANGE CONTROL

Any material requirement not expressly included in this scope must be treated as a change request.

Requirement → Clarification → Technical/Timeline Impact → Approval → Development

Major functionality should not be added from informal conversations without updating the agreed scope.

38 — CLIENT DEPENDENCIES

- Business/process information
- Approved content and assets
- SOPs/checklists
- Outlet/table/floor information
- Petpooja API access
- CCTV technical details/access

- Loyalty provider access
- UAT participation and consolidated feedback
- Availability of required third-party systems

39 — PHASE 1 DELIVERABLES

Deliverable	Expected output
Public Website	Responsive Mayflower website connected to relevant application functions.
Web Application	Secure customer and restaurant operations platform.
Customer Module	Profile, reservations, feedback and loyalty references where integrated.
Reservation & Table Module	Reservation workflow, table allocation and visual table/floor view.
Outlet Module	Multi-outlet creation, configuration and website publishing.
Operations Module	SOPs, checklists, tasks, photo/geo evidence and escalation visibility.
Management Module	Role-based dashboards and relevant operational/business views.
Integration Layer	Agreed Petpooja and loyalty integrations; CCTV where technically feasible.
Production Release	Tested, configured and deployed Phase 1 platform.

40 — FINAL PRODUCT DEFINITION

The Phase 1 product is a connected digital layer for Mayflower:

Website → Customer Experience → Web Application → Restaurant Operations → Integrations → Management Visibility

The core principle is to build a useful operational product around the systems Mayflower already uses, rather than creating unnecessary duplication.

41 — HANDOVER

- Production environment/URL
- Admin access
- User and role configuration
- Source repository/access as agreed
- Environment/configuration documentation
- Integration configuration details
- Basic deployment documentation
- Known limitations/dependencies
- UAT sign-off record
- Initial production verification
